Note: the paths in the code have to be updated to the path in the new system in order that the program works fine.

1- Open the QT application.
2- Press run on the bottom left of the QT interface.
3- Now a list of options will appear. Here are the main features:
    1- The user can select which algorithm to use in the program.
    2- We bear in mind VI people, so we made it available to read the result with 6 different voices and varying speed.
    3- There is a developer mode as well that can only be accessed by the developing team because it requires entering the correct password.
    4- The program also provides some methods to avoid plagiarism, showing a paraphrased text of the plagiarized sentences.
    5- After determining which sentences are plagiarized, some statistics are shown to illustrate the percentage of plagiarism and the complexity of the algorithm used as well as the time of execution of the code.

Have a nice experience :)
